# Normal probability density function

Standard Normal Distribution

## Standard Normal Distribution

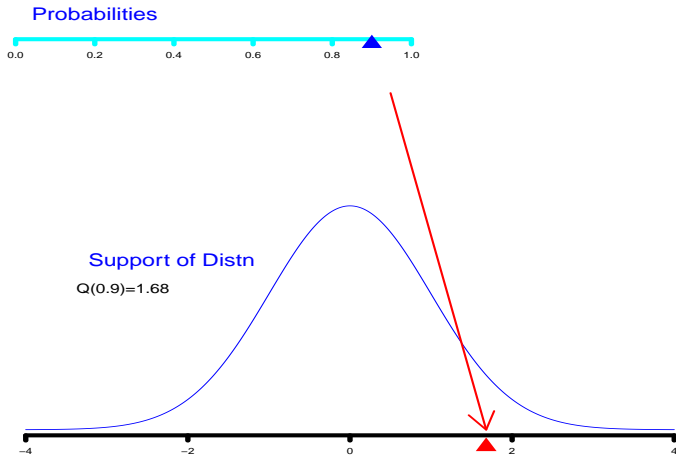

# Probability range

# Normal quantile

# Univariate quantile mapping

$$\begin{aligned}Q(a) &= \arg \min \mathbb{E} \{ |X - q| + (2a - 1)(X - q) \}, \\F_X(Q(a)) &= a.\end{aligned}$$

so  $a \leftrightarrow Q(a)$  is a bijection. This is extremely important for doing Statistics.

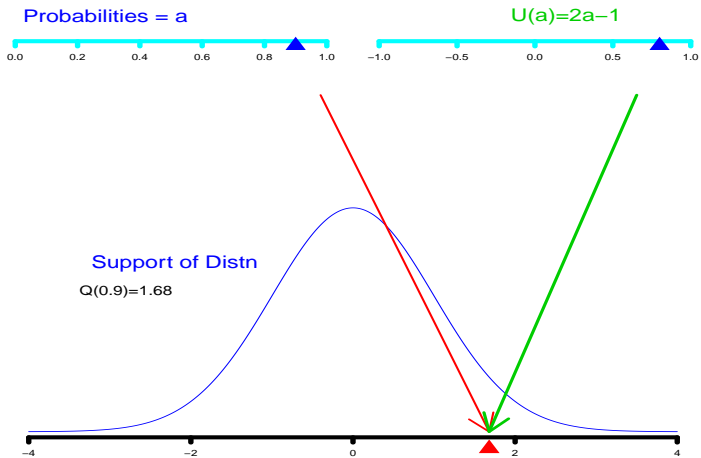

# A transformation

$$U(\text{Probability})=2 \text{ Probability} - 1$$

# Univariate quantiles

$$Q(a) = \arg \min \mathbb{E} \{ |X - q| + (2a - 1)(X - q) \}$$

Define

$$\begin{aligned} u &= 2a - 1, \\ Q(u) &= \arg \min \mathbb{E} \{ |X - q| + u(X - q) \} \end{aligned}$$

# Bivariate quantiles: domain

# Bivariate quantiles: range

# Bivariate quantiles

## Generalized spatial quantiles

For every  $\lambda \in \mathbb{R}$ , the **generalized spatial quantiles** minimize:

$$\psi_{u\lambda}(q) = \mathbb{E} \left[ |X_U - q_U| \left\{ 1 + \lambda(X_U - q_U)^{-2} \|X_{U^\perp} - q_{U^\perp}\|^2 \right\}^{1/2} + \beta(X_U - q_U) \right].$$

*Further generalization (not pursued):* For every  $k \geq 1$ , define

$$\psi_{u\lambda k}(q) = \mathbb{E} \left[ |X_U - q_U| \left\{ 1 + \lambda(X_U - q_U)^{-k} \|X_{U^\perp} - q_{U^\perp}\|^k \right\}^{1/k} + \beta(X_U - q_U) \right].$$

# Properties of generalized spatial quantiles

## Generalized spatial quantiles minimize:

$$\Psi_{u\lambda}(q) = \mathbb{E} \left[ |X_U - q_U| \left\{ 1 + \lambda (X_U - q_U)^{-2} \|X_{U^\perp} - q_{U^\perp}\|^2 \right\}^{1/2} + \beta (X_U - q_U) \right].$$

## Theorem

Write  $\Psi_{u\lambda}(\cdot) = \mathbb{E}f(X, \cdot)$ . Let  $g(X, \cdot)$  be the subgradient of  $f(X, \cdot)$ ,  $q^*$  the unique minimizer of  $\Psi_{u\lambda}(\cdot)$ , and  $q_n$  a minimizer of its sample version.

- 1  $q_n \rightarrow q^*$  almost surely as  $n \rightarrow \infty$ .
- 2 If  $\mathbb{E}\|g(X, q^*)\|^2 < \infty$  and if  $\mathbb{E}f(X, q)$  is twice continuously differentiable at  $q^*$  with the second derivative  $H$  being positive definite, then as  $n \rightarrow \infty$

$$n^{1/2}(q_n - q^*) = -n^{-1/2}H^{-1}S_n + o_P(1),$$

where  $S_n = \sum_{i=1}^n g(X_i, q^*)$ .

## Theorem

- 1 *Under the conditions of the previous item, the generalized bootstrap approximation for the distribution of  $n^{1/2}(q_n - q^*)$  is consistent, and hence resampling may be used for statistical inference.*

## Theorem

1 In addition to the conditions of the previous Theorem, assume that

$$\begin{aligned} \left\| \frac{\partial}{\partial q} \mathbb{E} \Psi_{u,\lambda}(X, q) - \frac{\partial^2}{\partial q^2} \mathbb{E} \Psi_{u,\lambda}(X, q^*) (q - q^*) \right\| &= O(\|q - q^*\|^{(3+s)/2}) \text{ as } q \rightarrow q^*, \\ \mathbb{E} \|g(X, q) - g(X, q^*)\|^2 &= O(\|q - q^*\|^{1+s}) \text{ as } q \rightarrow q^*, \\ \mathbb{E} \|g(X, q)\|^r &< \infty \text{ as } q \rightarrow q^*, \end{aligned}$$

for some  $s \in (0, 1)$  and  $r > (8 + p(1 + s))/(1 - s)$ . Then the following asymptotic Bahadur-type representation holds with probability 1:

$$n^{1/2}(q_n - q^*) = -n^{-1/2} H^{-1} S_n + O(n^{-(1+s)/4} (\log n)^{1/2} (\log \log n)^{(1+s)/4})$$

as  $n \rightarrow \infty$ .

### Generalized spatial quantiles minimize:

$$\Psi_{u\lambda}(q) = \mathbb{E} \left[ |X_U - q_U| \left\{ 1 + \lambda (X_U - q_U)^{-2} \|X_{U^\perp} - q_{U^\perp}\|^2 \right\}^{1/2} + \beta (X_U - q_U) \right].$$

Set  $\lambda = 0$  to get **projection quantiles**.

### Theorem

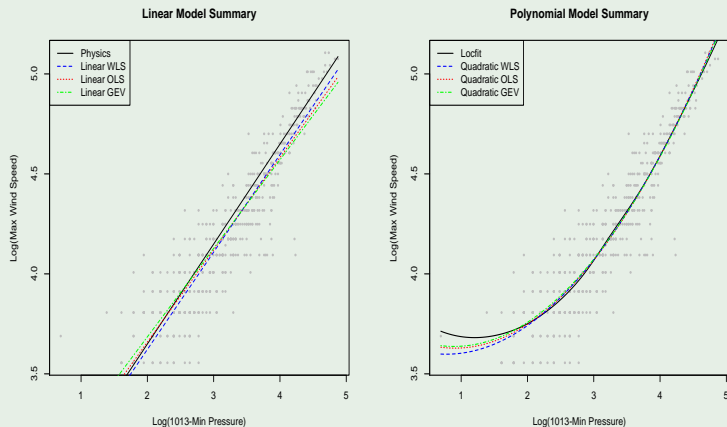

*Projection quantiles have a one-to-one relationship with the unit ball, like univariate quantiles.*

- Computationally extremely simple, no limitations from sample size and dimension (high  $p$ , low  $n$  allowed).
- Projection quantiles based confidence sets have exact coverage.
- For any  $\lambda$ , we now have asymptotic results as  $\beta \rightarrow 1$ . This provides a potentially new way of doing multivariate extreme values.

## Applications: climate and beyond

- We have used some of these techniques to study *joint extreme value properties* of climate variables, eg, hurricane windspeed and pressure.
- We have used these to study *change in tail behavior* of climate characteristics.
- We are studying multivariate (extreme) quantile regression.
- Study relations between climate and economic or biological variables.
- Other application domains might be in finance, genomics, *Idots*.
